

TPG Telecom Private Cloud

Moving to the cloud is more important than ever in an era of remote working and modernisation. However, uncertainty around control, costs, network performance, and migration complexity can hold some businesses back.

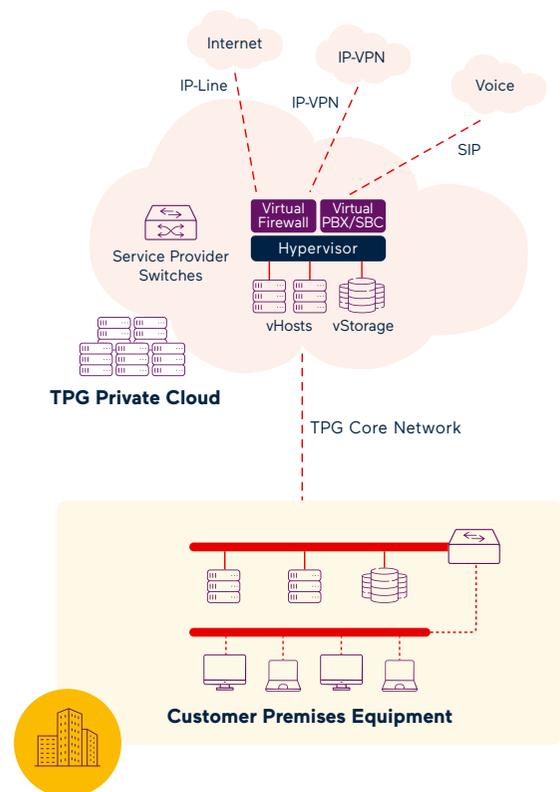

What if you could move to a private cloud and achieve similar control and visibility as an on-premises or co-located service with clarity around price, reliability, scalability, and simplicity?

With TPG Telecom Private Cloud, you have the potential to achieve this and more. We let you focus on what's important to your business while we manage the cloud hardware infrastructure.

What is TPG Telecom Private Cloud?

TPG Telecom Private Cloud offers raw compute and storage-as-a-service from TPG Telecom's owned and operated data centres.

We can manage your cloud compute and storage infrastructure including maintenance, break-fix, and more, so you can focus on growing your business.

What makes TPG Telecom Private Cloud different from other clouds?

TPG Telecom Private Cloud isn't like other cloud environments. Specifically, we offer:

Bill shock protection: an all-inclusive, fixed price service means you know what you'll pay each month.

Security: TPG Telecom Private Cloud is stored within TPG Telecom's core secure data centres which means you benefit from the same enterprise-grade security measures that protect our own business.

High speed: by using our high-speed, high-bandwidth, low-latency connections, you get the ultimate in performance, with reliability and a user experience that's hard to distinguish from on-premises infrastructure.

Fast provisioning: we can provision your private cloud infrastructure fast; in some cases, we can achieve this within a couple of hours compared to the weeks or months it can take for other providers.

Return on investment: because of our unique delivery model, you can repurpose and reuse existing assets, such as your licences from providers including Microsoft, VMWare, Veeam, and more.

Local support: we provide 24/7 business support and dedicated account management by an all-local cloud support team.

Simplicity: migrating from your environment to TPG Telecom Private Cloud is simple and minimally disruptive; some of our clients have migrated during business hours with minimal discernible interruption to users.

A scalable, simple solution that makes it easy to get started

Simplicity lets you get up and running sooner

Our private cloud service catalogue is designed to be ultra-simple compared to the catalogues of other cloud providers. This means your IT staff can quickly and easily determine how to structure your TPG Telecom Private Cloud to get you up and running sooner.

High speed connectivity makes applications perform better

As a major telco, TPG Telecom owns the carriage network. This means we can effectively provide you with high-bandwidth connections at a flat or fixed rate into your cloud environment.

We give you control and support your existing environment

We take on the burden of power and network resiliency, as well as hardware management, while giving you total control of your environment. Many other providers lock down elements of cloud, preventing you from getting the seamless experience that TPG Telecom Private Cloud may offer. Our platform likely supports your existing environment as it is so you don't need to make big changes to be cloud ready.

We've got your multi-site business covered

With four data centre locations across New South Wales, Victoria, and Queensland, TPG Telecom Private Cloud allows for multi-site coverage in these states. And, we work with enterprise-grade vendors to underpin our platform, including Cisco and NetApp.

Improve the user experience and save time and money

If you're still wrestling with unwieldy on-premises or public cloud infrastructure, now is the time to take back control. TPG Telecom Private Cloud may be able to significantly improve your end users' experience with software and applications, making them more productive and engaged. It may save your business both time and money, freeing up your IT team and your capital to focus on innovation and growth-oriented activities.
